Figure: Different Editing Features in AutoCAD The tool palettes available to you are dictated by your software version and AutoCAD product option. In Figure 6.1, for example, you can see that the My Options dialog box has two sections that list product option information (refer to Figure 6.1a). If you're using the AutoCAD LT (Desktop) or LT (Web), the product option tool palettes include a number of graphic editing features. However, in the case of AutoCAD Classic, the graphic editing features are limited to the basic ones. In all the following sections, we'll describe the different graphic features available in the new AutoCAD LT or LT, and the basic version. You can learn more about

each AutoCAD product here. You'll notice that some of the graphic editing tools in AutoCAD have a small icon in the upper-right corner of the tool. In this case, the icon indicates that the tool is available as a component in the AutoCAD LT product.

Figure 6.1: You can view the product options in the My Options dialog box. In Figure 6.2, the first graphic tool is the Sweep tool. The Sweep tool enables you to draw free-form splines that look like the lines you'd draw using a pencil on a piece of paper. You can adjust the slope of a spline using the Handle Distance

Budd-Chiari syndrome associated with persistent hyperferritinemia and a hyperactive TGF-beta signaling pathway. Although an association between Budd-Chiari syndrome (BCS) and iron overload has been reported, the mechanism of hyperferritinemia remains unknown. We report two cases of BCS associated with hyperferritinemia and liver enlargement. In both cases, the degree of hepatic iron deposition and serum ferritin level were less than those in classical BCS. Both patients had a mildly depressed serum transferrin saturation, suggesting that iron overload is not a primary cause of the liver enlargement.

Serum concentrations of transforming growth factor beta1 (TGF-beta1) were markedly increased, whereas both transferrin receptor 1 (TfR1) mRNA expression and total TfR protein expression in peripheral blood mononuclear cells were normal. An elevated serum level of interleukin-6 was observed in the second patient, suggesting the presence of a hyperactive TGF-beta signaling pathway. The excess TGF-beta in the serum might be associated with iron overload. Our observations demonstrate that TGF-beta signaling is involved in the pathogenesis of BCS, even though there is mild iron overload. This study also suggests that the degree of hepatic
