AutoCAD is mostly popular for its wireframe and surface construction (plotter) drawings. Also, AutoCAD has features useful in architecture and engineering such as construction of architectural drawings, planes and surfaces from AutoCAD drawings and blocks, and a tool to search for similar entities in the project database. AutoCAD has its other features such as animation, digital milling, fluid simulation, and roughing tools. With the introduction of AutoCAD in 1982, several competing CAD programs were also released. While AutoCAD is an industry-leading program, competitors such as Maya, 3ds Max and SolidWorks have a vast user base and are still actively developed. While some of these competitors are still compatible with AutoCAD, the first version of AutoCAD was the most sophisticated and advanced CAD program of its time. Top 10 AutoCAD Tips and Tricks: 1. Insert Symbols/Mats In AutoCAD, symbols and mats are two types of object in the drawing. Symbols are generally used to represent the shapes. AutoCAD enables you to insert symbols by using the Insert Symbol menu or Symbol panel. Mats are used to represent the color of the drawing. MAT symbol is used to represent the color of the drawing. To insert an object in a drawing, you can either select an object from the list or drag and drop the object into the drawing. To insert an object, you can select Insert - Symbols/Mats from the Drawing drop-down menu. You can also use the Insert menu and select a specific type of object. If the command needs an object to be selected, you can select the drawing element first and then select the type of command using the Insert menu from the Drawing - Insert submenu. To insert the symbol or mat, choose Insert - Symbols/Mats from the Insert menu. After selecting the symbol, you can move, rotate or scale the symbol. To insert the color of the object, select the symbol or object and then choose Color - Edit Colors from the Symbol menu. 2. Hide/Unhide Entities You can also change the state of the entity in the drawing using the entity picker. The entities in the drawing are selected in different states: Click the eye icon to show or hide an entity. Select the Entity Picker option from the View menu, and then

CAD software application layer automation is not limited to drawing files and may be extended to an enterprise information system using the XML database. It can use AutoCAD's.NET object based API. The AutoLISP API also provides for this. A range of XML-based files like DWG XML, DWF XML, DFX XML and others may be imported into the drawing. These files are converted to DWG, with the coordinates, linetypes and other parameters remaining unchanged. These various APIs can be used for enterprise integration. The file import process may use the API to parse the file. It may also use the API to modify drawing information, if needed. A drawing may be created by using one of the supported APIs. For example, a user may add a line to the drawing from an Excel spreadsheet. AutoCAD is the de facto standard for the preparation and exchange of engineering drawings and technical information of the automotive industry. These drawings are mainly used for prototyping and engineering development. They are part of the development process. During the development of a vehicle a designer prepares an electronic drawing of the project. This drawing represents the planned and functional

vehicle. This drawing is often also used in the commercialization process, with the aim of mass production. It is often used for advertising, marketing and sales. A set of rules for naming the drawings is commonly applied to ensure that files created are compatible and can be used across multiple vehicles. An electronic drawing is part of the project documentation. In the project documentation, it is often required to gather all information that may be required to implement a specific requirement. The electronic drawing is the content of this documentation. This content is usually organized in the form of a document or a set of files. The files may include some application specific requirements. For example, the project may require a model of the vehicle. This requirement is usually represented in a file that can be used by a mechanical engineering application. An electronic drawing is part of the design process. The design process comprises a number of activities and methods. These activities and methods require a number of files to be prepared. The drawing represents the end of the process and is part of the documentation. As the drawings are prepared and assembled, they are organized in a particular way. The structural analysis is performed on the design data using the CAD system. A model may be made using the CAD system. An analysis may then be performed on this model. During the analysis the information is output in the form of a a1d647c40b
