Go Online. Nefertiti Luxury collection [Digital Free][CRACK] special edition [Script][CODEC] by. .Q: I am getting a key error on the second time I run this script edit: I made this question worse than it was before. I'm not asking about what to do when an error occurs. This error is happening before it raises any errors. I'm trying to make a program that inputs two lists and returns the elements from both lists that occur together. I have to keep using some methods that are only implemented in this specific version of python and I'm getting errors.

```
import sys
import os
fileName = os.path.normpath(os.path.join(os.path.split(__file__)[0], 'data/lists.txt'))
inputFile = open(fileName, 'r')
lines = inputFile.readlines()
inputFile.close()
inputLine = inputFile.readline()
inputFile.close()
userList = []
pair = []
for i in lines:
    pair = line.split(" - ")
    userList.append(pair[0])
    userList.append(pair[1])
outputFile = open(fileName, 'w')
pairList = [x for x in userList for y in userList if x == y]
for y in pairList:
    outputFile.write(y)
print y
inputLine = inputFile.readline()
outputFile.close()
inputFile.close()
inputLine = inputFile.readline()
The error I'm getting is: Traceback (most recent call last): File "c:/Users/Brian/Desktop/notions_final.py", line 16, in
```
